

LOWCODE

EXPERIMENT -1

COMPARATIVE STUDY OF TRADITIONAL AND LOW CODE DEVELOPMENT

NAME : T GAYATHIRI

ROLL NO : 240701140

Aim :

To study the traditional software development approach and the low-code development approach and compare them.

Introduction :

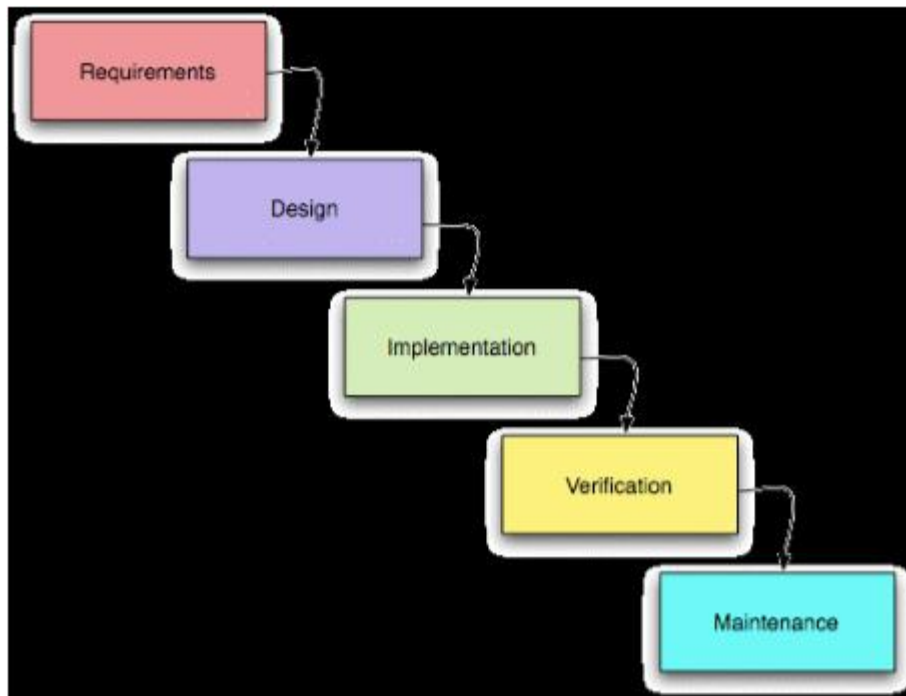

Software development is the process of designing, developing, testing, and maintaining applications. There are two common approaches: **Traditional Development** and **Low-Code Development**. Traditional development requires manual coding, while low-code development uses visual tools and minimal coding to build applications quickly and efficiently.

Traditional Development Approach :

Traditional development is the process of building software by writing code manually using programming languages. It follows the Software Development Life Cycle (SDLC) and is suitable for developing complex and customized applications.

Stages

- Requirement Analysis
- System Design
- Coding
- Testing
- Deployment
- Maintenance

Low-Code Development Approach

Low-code development is a software development approach that uses visual tools, drag-and-drop components, and pre-built templates to create applications with minimal coding. It helps reduce development time and increases productivity.

Stages

- Requirement Analysis
- Visual Design
- Drag-and-Drop Development
- Testing
- Deployment
- Maintenance

Comparison of Traditional and Low-Code Development

Traditional Development	Low-Code Development
Manual coding	Minimal coding
More development time	Faster development
Higher development cost	Lower development cost
Requires skilled programmers	Easy to learn and use
Best for complex applications	Best for business applications
Manual deployment	Quick deployment

Result:

The study shows that Traditional Development requires more coding, time, and cost, while Low-Code Development is faster, easier, and needs less coding. Both methods are useful, and the choice depends on the project requirements.
